Re: Application for Software Development Specialist - Req ID: 117245

Dear Schneider Electric Recruitment Team,

As a software professional with a foundational background in Engineering Physics and a recent certification in Sustainable Business, I was thrilled to see the opening for a Software Development Specialist within the Utility Scale Solar Services team. I have long admired Schneider Electric's role in driving the global energy transition, and I am eager to apply my experience in complex software systems and power simulations to support the long-scale reliability of your renewable energy portfolio.

The job description emphasizes the need for an engineer who can navigate complex, existing systems and perform deep root-cause analysis. My career has been defined by this exact challenge. During my time with the [Wisconsin Power Systems Group](#), I utilized MATLAB to simulate complex power grids and analyze the stability of grid-following and grid-forming control schemes. This experience gave me a fundamental understanding of the physical and electrical constraints that govern the power conversion technologies Schneider Electric supports. Similarly, in [UBC Sailbot](#), I led the revival of the previous year's robotic sailboat implemented by previous alumni in Python. After thoroughly understanding the existing code and documenting the logic, I implemented new behaviours that enabled a perfect finish at the annual sailing regatta. In essence, I do not just code; I understand the systems that the software is designed to manage.

Beyond domain knowledge, I bring a proven track record in the product engineering lifecycle mentioned in your requirements:

- **Automation & Tooling:** At [OPEN Technologies](#), I built the companies' [CMS](#) and associated tools, including Makefile recipes and Ansible deployment routines, that are still in use today.
- **System Maintenance & Reliability:** As a full-stack developer at OPEN Technologies and Proof, I maintained complex, large-scale software environments. I am comfortable working within established CI/CD pipelines, managing source control via Git, and performing the rigorous testing necessary to ensure software reliability across the product stack.
- **Knowledge Transfer:** I understand that the value of a specialist lies in their ability to preserve technical intelligence. I have a history of creating clear, actionable documentation to ensure that critical engineering knowledge remains accessible to future teams. At OPEN, for example, my CMS documentation was so extensive that my former coworker emailed me to thank me for the notes.

Schneider Electric's commitment to "IMPACT" values—specifically Mastery and Curiosity—resonates deeply with my professional identity. My transition from experimental physics into software development is a testament to my drive to master new, complex technologies and apply them to sustainability. In addition, I explore my curiosity when building hobby projects such as [GRID Arcade](#), a mini-arcade I built in C++ to learn embedded development skills and game design.

I am excited about the possibility of contributing to the long-term success of your solar and power conversion products. Thank you for your time and for considering my application. I look forward to the possibility of discussing how my technical background can support the continued excellence of the Utility Scale Solar Services team.

Sincerely,

Bryan L. Luu
